Performance verification

A precision sphere has to be measured with 25 probings. PFTU is the range of all radii. The range of all radii must be within MPE($PFTU$).

MPE(THP)/ $MPT(\tau)$: A precision sphere has to be scanned with 4 defined lines. THP is the range of all radii with the predefined path.

MPE(THN)/ $MPT(\tau)$: A precision sphere has to be scanned with 4 defined lines. THN is the range of all radii with the non-predefined path.

The range of all radii and the scanning time must be within MPE(THP/THN) and $MPT(\tau)$.

A ring gauge is measured in scanning mode, with high points density. The range of radial distances from two concentric circles enclosing the roundness profile and having the least radial separation, is then evaluated. The range of radial distances must be within RONt.

NOTE: ISO 10360-2:2009 test with maximum part weight performed as an option upon request only.
